Release notes from v1.1: Updated for clarification on PM3 and BP2, and typo correction.

Gene	Disease	Transcript				
LDLR	hypercholesterolemia, familial (MONDO:0007750)	NM_000527.5				
PATHOGENIC	CRITERIA					
Criteria	Criteria Description	LDLR Specification				
VERY STRONG	CRITERIA					
PVS1	See PVS1 flow diagram (Figure 1).	Disease specific / strength				
STRONG CRITI	ERIA					
PS1	Missense variant at the same codon as a variant classified pathogenic (by these guidelines), and predicts the same amino acid change. Caveat: there is no <i>in silico</i> predicted splicing impact for either variant.	Clarification				
PS2	Variant is <i>de novo</i> in a patient with the disease and no family history. Follow SVI guidance for <i>de novo</i> occurrences: https://clinicalgenome.org/working-groups/sequence-variant-interpretation/	Clarification				
PS3	Variant meets Level 1 pathogenic functional study criteria. See Table 3 .	Disease specific / strength				
PS4	Variant is found in ≥10 unrelated FH cases (FH diagnosis met by validated clinical criteria). Caveat: variant must also meet PM2.	Disease specific / strength				
PVS1_Strong	See PVS1 flow diagram (Figure 1).	Disease specific / strength				
PM5_Strong	Missense variant at a codon with ≥2 missense variants classified pathogenic (by these guidelines), and predicts a different amino acid change.	Strength				
PP1_Strong	Variant segregates with phenotype in ≥ 6 informative meioses in ≥ 1 family. Must include ≥ 2 affected relatives (LDL-C >75th centile) with the variant.	Disease specific / strength				
MODERATE CRITERIA						
PM1	Missense variant located in exon 4, or a missense change in one of 60 highly conserved cysteine residues (listed in Supp. Table 4). Caveat : variant must also meet PM2.	Disease specific				
PM2	Variant has a PopMax MAF ≤0.0002 (0.02%) in gnomAD. Consider exceptions for known founder variants.	Disease specific				
PM3	This criterion can be used for a candidate <i>LDLR</i> variant observed in an individual with a homozygous FH phenotype when there is only one other pathogenic or likely pathogenic variant in <i>LDLR</i> (in <i>trans</i>), <i>APOB</i> or <i>PCSK9</i> . Caveat : variant must also meet PM2.	Disease specific				

This version is specified for the following genes: LDLR

Expert Panel Page: https://www.clinicalgenome.org/affiliation/50004

PM4	In-frame deletion/insertions smaller than one whole exon, or in-frame whole-exon duplications not considered in any PVS1 criteria. Caveat: variant must also meet PM2.	Disease specific
PM5	Missense variant at the same codon as a variant classified pathogenic (by these guidelines), and predicts a different amino acid change.	Clarification
PM6	See PS2 above.	Clarification
PS3_Moderate	Variant meets Level 2 pathogenic functional study criteria. See Table 3 .	Disease specific / strength
PS4_Moderate	Variant is found in 6-9 unrelated FH cases (FH diagnosis made by validated clinical criteria). Caveat: variant must also meet PM2.	Disease specific / strength
PP1_Moderate	Variant segregates with phenotype in 4-5 informative meioses in ≥ 1 family. Must include ≥ 2 affected relatives (LDL-C >75 th centile) with the variant.	Disease specific / strength
PVS1_Moderate	See PVS1 flow diagram (Figure 1).	Disease specific / strength
SUPPORTING O	CRITERIA	
PP1	Variant segregates with phenotype in 2-3 informative meioses in \geq 1 family. Must include \geq 1 affected relative (LDL-C >75 th centile) with the variant.	Disease specific / strength
PP2	Missense variant in a gene that has a low rate of benign missense variation and where missense variants are a common mechanism of disease.	N/A
PP3	REVEL score ≥0.75 (missense variants), or predicted impact to splicing using MaxEntScan (see Fig. 2 for suggested thresholds).	Disease specific
PP4	Any <i>LDLR</i> variant identified in an FH patient [diagnosis based on validated clinical criteria, e.g. Dutch Lipid Clinic Network (≥6), Simon Broome (possible/definite), MEDPED], after alternative causes of high cholesterol are excluded . Caveat: variant must also meet PM2.	Disease specific
PP5	Reputable source recently reports variant as pathogenic but the evidence is not available to the laboratory to perform an independent evaluation.	N/A
PS3_Supporting	Variant meets Level 3 pathogenic functional study criteria. See Table 3 .	Disease specific / strength
PS4_Supporting	Variant is found in 2-5 unrelated FH cases (FH diagnosis made by validated clinical criteria). Caveat: variant must also meet PM2.	Disease specific / strength

This version is specified for the following genes: LDLR

Expert Panel Page: https://www.clinicalgenome.org/affiliation/50004

BENIGN CRITE	BENIGN CRITERIA						
STAND ALONE	CRITERIA						
BA1	BA1 Variant has a PopMax FAF ≥0.005 (0.5%) in gnomAD. Disease specific						
STRONG CRITI	ERIA						
BS1	Variant has a PopMax FAF ≥0.002 (0.2%) in gnomAD.	Disease specific					
BS2	Variant is identified in ≥3 heterozygous or ≥1 homozygous well- phenotyped, untreated, normolipidemic adults (unrelated).	Disease specific					
BS3	Variant meets Level 1 benign functional study criteria. See Table 3 .	Disease specific / strength					
BS4	Lack of segregation in ≥2 index case families (unrelated), when data is available for >2 informative mejoses in each family						
SUPPORTING O	CRITERIA						
BP1	Missense variant in gene where only LoF causes disease.	N/A					
BP2	If a FH patient with a heterozygous phenotype has a pathogenic or likely pathogenic variant in <i>LDLR</i> (in <i>trans</i>), <i>APOB</i> or <i>PCSK9</i> , BP2 is applicable to any additional <i>LDLR</i> variants.	Disease specific					
BP3	In-frame deletions/insertions in a repetitive region without a known function.	N/A					
BP4	REVEL score ≤0.5 (missense variants), or no predicted impact to splicing using MaxEntScan (see Fig. 2 for suggested thresholds).	Disease specific					
BP5	Variant found in a case with an alternate molecular basis for disease.	N/A					
BP6	Reputable source recently reports variant as benign but the evidence is not available to the laboratory to perform an independent evaluation.	N/A					
BP7	Variant is synonymous. Caveat: variant must also meet BP4 (i.e. no predicted impact on splicing).	Disease specific					
BS3_Supporting	Variant meets Level 3 benign functional study criteria. See Table 3 .	Disease specific / strength					

Abbreviations: FH, familial hypercholesterolemia; MAF, minor allele frequency; FAF, filtering allele frequency; LoF, loss of function. Note: PopMax refers to the gnomAD subpopulation with the highest allele frequency.

12	11116859	11116998	1706	1845	140	1	0
13	11120092	11120233	1846	1987	142	0	1
14	11120370	11120522	1988	2140	153	1	1
15	11123174	11123344	2141	2311	171	1	1
16	11128008	11128085	2312	2389	78	1	1
17	11129513	11129670	2390	2547	158	1	0
18	11131281	11133820	2548	2583	35	0	-

Phase: the position of an exon/intron boundary within a codon. A phase of zero means the boundary falls between codons, one means between the first and second base and two means between the second and third base. Genomic (g.) coordinates correspond to reference sequence NC_000019.9, and coding (c.) coordinates correspond to *LDLR* transcript NM 000527.5.

This version is specified for the following genes: LDLR

PS3, BS3

Functional study criteria specifications for LDLR.

Table 3. PS3/BS3 functional study criteria specifications for *LDLR*.

Pathogenic	
PS3 (Level 1)	(1) Study of the <i>whole</i> LDLR cycle (LDLR expression/biosynthesis, LDL binding, and LDL internalization) performed in heterologous cells (with no endogenous LDLR) transfected with mutant plasmid. Assay result of <70% of wild-type activity in either expression/biosynthesis, binding OR internalization.
PS3_Moderate (Level 2)	 (1) Study of a) only <i>part</i> of the LDLR cycle following Level 1 methodology, or b) <i>whole or part</i> of the LDLR cycle in true homozygous patient cells. A variant with assay results of <70% of wild type activity in either LDLR expression/biosynthesis, LDL binding OR internalization. (2) RNA studies, using RNA extracted from heterozygous or true homozygous patient cells, where aberrant transcript is confirmed by sequencing and is quantified as >25% of total transcript from heterozygous cells or 50% of total transcript from homozygous cells. (3) Variants with two or more Level 3 functional studies (must be different assays); or any Level 3 functional study #1-4 performed by two or more independent labs with concordant results.
PS3_Supporting (Level 3)	 (1) Study of LDLR cycle (<i>whole or part</i>) in heterozygous patient cells, with assay results of <85% of wild-type activity in either LDLR expression/biosynthesis, LDL binding OR internalization. (2) Luciferase studies with transcription levels of <50% compared to wild-type (applicable to 5'UTR/promoter variants). (3) Minigene splicing assays with <10% wild-type transcript present where an aberrant transcript from the candidate variant is confirmed by sequencing. (4) High-throughput assays, which include alternative microscopy assays (e.g., Thormaehlen et al., 2015), Multiplex Assays of Variant Effect (MAVE) (e.g., Weile & Roth, 2018) and deep mutational scanning assays, can be considered

This version is specified for the following genes: LDLR

Expert Panel Page: https://www.clinicalgenome.org/affiliation/50004

	here, only if assay has been validated with a minimum of four pathogenic and four benign variant controls in LDLR. *Note: % activity thresholds will be defined by the FH VCEP as more data becomes available. (5) RNA studies, using RNA extracted from heterozygous or homozygous patient cells, with aberrant transcript confirmed by sequencing (but without transcript quantification).
Benign	
BS3 (Level 1)	(1) Study of the <i>whole</i> LDLR cycle (LDLR expression/biosynthesis, LDL binding, and LDL internalization) performed in heterologous cells (with no endogenous LDLR) transfected with mutant plasmid. Assay result of >90% of wild-type activity in expression/biosynthesis, binding AND internalization. Note: studies of only part of the LDLR cycle are not eligible for BS3 or BS3_Supporting.
BS3_Supporting (Level 3)	 (1) Study of whole LDLR cycle in a) true homozygous patient cells, with assay result of >90% of wild-type activity in biosynthesis, binding AND internalization; or in b) heterozygous patient cells with assay result of >95% of wild-type activity in biosynthesis, binding AND internalization. (2) Luciferase studies with transcription levels of >90% when compared to wild-type (applicable to 5'UTR/promoter variants). (3) RNA studies, using RNA extracted from heterozygous or homozygous patient cells, with a) aberrant transcripts quantification, where aberrant transcript is <10% of total transcript OR b) without transcript quantification where no aberrant transcript is confirmed by sequencing. (4) Minigene splicing assay where only wild-type transcript is present and confirmed by sequencing. (5) High-throughput assays as defined above; only applicable when assay can indicate the whole LDLR cycle (LDLR expression/biosynthesis, LDL binding AND internalization) is unaffected.

Note: functional assays performed in compound heterozygous patient cells are not considered applicable in PS3/BS3 criteria since it is difficult to delineate the individual effect of each variant.

Adapted from Guo et al., 2019. Residues correspond to LDLR transcript NM_000527.5.

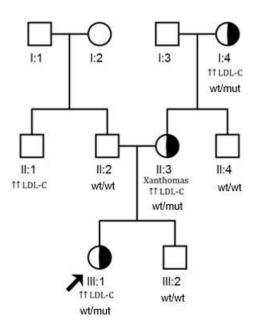

Abbreviations: Cys, cysteine; EGF, epidermal growth factor

This version is specified for the following genes: LDLR

Expert Panel Page: https://www.clinicalgenome.org/affiliation/50004

PP1, BS4

Pedigree of a FH family.

Supplementary Figure 2. Pedigree of a FH family.

Index case is identified with an arrow. Half-filled symbols represent heterozygous individuals.

Index case III:1 inherited her *LDLR* variant from the maternal (II:3) side of the family. Her father (II:2) has normal cholesterol, no cardiovascular disease history, and is negative for the *LDLR* variant; therefore, her father (II:2) and paternal uncle (II:1) should not be considered in the co-segregation study. Similarly, the maternal grandfather (I:3) should not be considered.

In this family the individuals that can be considered informative meioses are the index case's brother (II:2), mother (II:3), maternal uncle (II:4) and maternal grandmother (I:4).

Index cases should not be counted as positive cases for co-segregation results.

ClinGen FH ACMG Specifications v1.2

This version is specified for the following genes: LDLR

Expert Panel Page: https://www.clinicalgenome.org/affiliation/50004

BA1, BS1, PM2

LDLR-specific population data frequency thresholds.

Table 2. *LDLR*-specific population data frequency thresholds.

	gnomAD	Prevalence	Penetrance	Allelic Het.	Genetic Het.
	Frequency				
BA1	PopMax FAF	1/250	50%	1.0	1.0
	≥0.005 (0.5%) ^a				
	PopMax FAF				
BS1	≥0.002 (0.2%) and <0.005 (0.5%)	1/250	95%	1.0	0.9
PM2	PopMax MAF	1/250	95%	0.1	0.9
	≤0.0002 (0.02%)				

Note: PopMax refers to the gnomAD subpopulation with the highest allele frequency. ^a BA1 metrics were equal to 0.4%; however, we conservatively increased the BA1 threshold to 0.5%. Abbreviations: FAF, filtering allele frequency; MAF, minor allele frequency; Het., heterogeneity.

PP3, BP4

Do not apply if PVS1 (or modified strength) is met.

If both "missense" and splicing prediction are applicable, only 1 prediction of affecting function is necessary to apply PP3, but both need to predict a benign effect for BP4 to be given.

In silico classification of missense variants in LDLR

We recommend the use of REVEL,

- a) scores above 0.75 as supportive evidence of pathogenicity (PP3),
- b) scores below 0.50 as supportive evidence of benign (BP4).

This document is archived and versioned on ClinGen's website. Please check https://www.clinicalgenome.org/affiliation/50004/docs/assertion-criteria for the most recent version.

ClinGen FH ACMG Specifications v1.2

This version is specified for the following genes: LDLR

Expert Panel Page: https://www.clinicalgenome.org/affiliation/50004

In silico prediction of splicing effects in LDLR

Do not apply if *splicing* functional data is available. Apply A, B or C based on variant location and use MaxEntScan (MES) for scores:

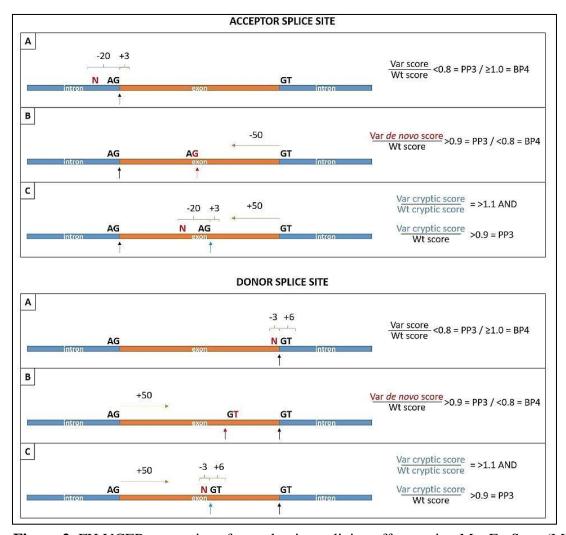

Figure 2. FH VCEP suggestions for evaluating splicing effects using MaxEntScan (MES) dependent on variant location A, B, or C.

This version is specified for the following genes: LDLR

Expert Panel Page: https://www.clinicalgenome.org/affiliation/50004

- (A) Variant is located at -20 to +3 bases related to the authentic acceptor splice site or at -3 to +6 related to the authentic donor splice site: A result of authentic splice site strength variant/wild-type score <0.8 is supportive evidence of pathogenicity (PP3), while a score \ge 1.0 is supportive evidence of benign (BP4).
- (B) Variant creates *de novo* acceptor splice site, which is at least 50 bases upstream of the authentic donor splice site, or *de novo* donor splice site, which is at least 50 bases downstream of the authentic acceptor splice site: A result of *de novo* splice site strength variant/authentic wild-type score in >0.9 is applicable to PP3, while a score <0.8 is applicable to BP4.
- (C) Variant is located at -20 to +3 bases relative to an intra-exonic AG dinucleotide, which is at least 50 bases upstream of the authentic donor splice site, or at -3 to +6 bases relative to an intra-exonic GT dinucleotide, which is at least 50 bases downstream of the authentic acceptor splice site: Results of both variant cryptic/wild-type cryptic score in >1.1 and cryptic acceptor/authentic acceptor score or cryptic donor/authentic donor score in >0.9 is applicable to PP3.

Note: BP4 is applicable to exonic variants outside of the 50 base limits detailed above, given the unlikelihood of such variants to impact splicing in *LDLR*.
